RAPIDOBJECTS

Rapid Business Intelligence Data Mart Architecture and Project Management Training

The quickest (and best) way to get started developing valuable business intelligence applications is to focus on a single business process and to put together the information required to help employees make that process work better. This can be done by developing a data mart for that process.

This class provides the background to make intelligent data mart design and planning decisions. Learn best practices and examine templates for data mart requirements analysis and project planning.

Topics

- Rapid business intelligence requirements analysis
- Defining business drivers and key performance indicators
- Estimating return on investment
- Data warehousing components
- Tool selection
- Applicable standards
- Estimating data mart sizes
- Example deliverables
- Example project plans
- Resource requirements

This class will be valuable to both students who have not yet developed a data mart or business intelligence application and students who have been involved in one or two data marts and are not certain if they are employing the currently available best practices in business intelligence.

In the class, students build up business intelligence data mart project materials. In this way, they can apply the specific strategies, project plans, techniques, and technologies to their own organizations' data mart projects.

Prerequisites

Knowledge of at least one business process and the type of data associated with it is recommended. If the students can bring in sample reports or data extracts from existing systems, they may be used in the class as examples for project planning.

Who Should Attend?

People from aerospace/defense, manufacturing, telecommunications, health care, insurance, financial services, professional services, travel, government, and e-commerce, who will be involved in the key roles of developing a data mart including:

- Project managers and business analysts
- Data modelers and database administrators
- Extract, transform, and load experts and analytic application developers

Ordering Information:

Business Intelligence Data Mart Architecture and Project Management Training
P/N--RBI 7071
Price--$350 per student (minimum 5)
Deliverable--Two-day training class covering:

- Data Mart Architecture and Project Management
